

Imaging Data

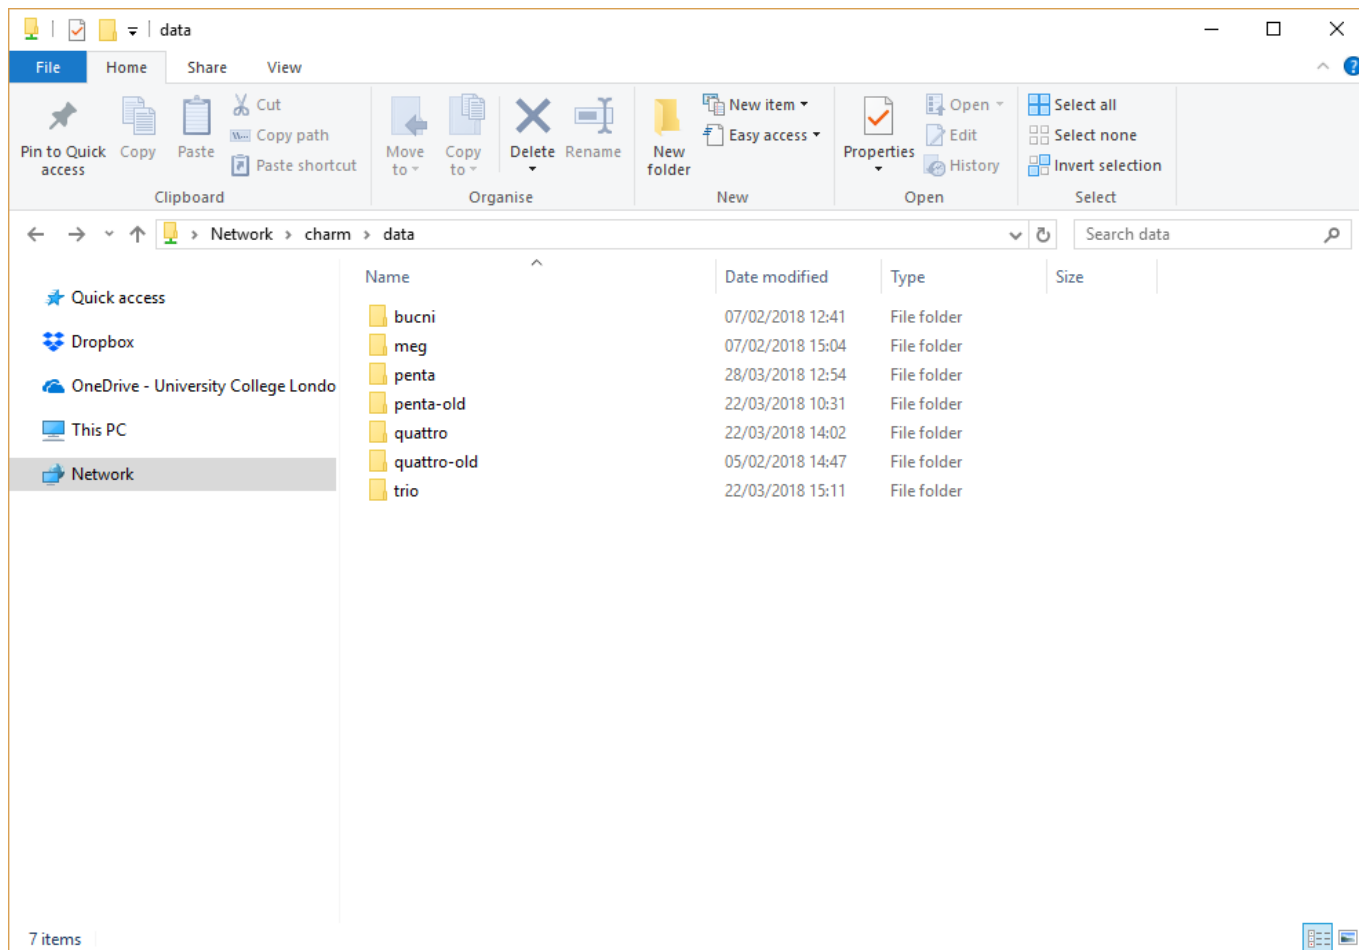

Data from the MRI and MEG scanners is transferred by the radiographers to a server called Charm where it is automatically anonymised. Providing there are no issues with the headers due to incorrect subject registration, the data should be available the following day. If there are issues found, your data will be quarantined by the system. Data is stored in directories corresponding to the name of the scanner it was gathered with (i.e. Trio, Quattro, Penta, MEG) and each series is a separate, compressed .tar.bz2 file

Although data is kept indefinitely, please **collect and reconstruct it promptly**. This means that if you're not acquiring what you think you're hoping for, you discover this before running an entire series of subjects. Also, in rare instances, some of your data may not be transferred to Charm. This data would then be lost when the scanners are cleared, which can be weekly. If you notice anything missing, please inform IT or the radiographers sooner rather than later.

A copy of the data on Charm is backed up to tape and stored off-site, so please do not keep local copies of the **unprocessed** data on your D:\ drive as we do not want to back up the same data twice.

From a WCHN-managed machine

If your PC is managed by WCHN IT (computers at the FIL and MPC), the data directories can be accessed from Windows Explorer by typing [\\charm\data](#) in the address bar. You can also create a shortcut on your desktop. The directories suffixed with '-old' contain data prior to the Prisma-fit upgrade.

SFTP server

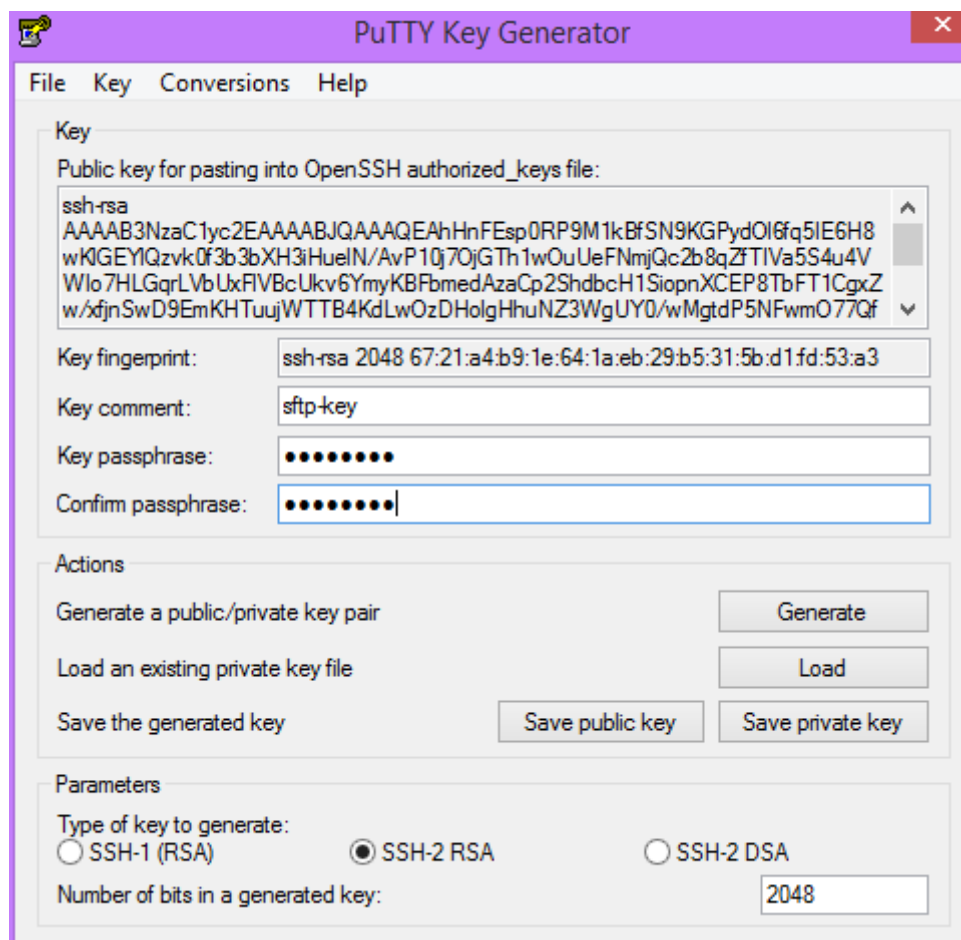

If your PC is not managed by WCHN IT, we recommend that data is collected using our SFTP server with public key authentication. This requires some configuration to get working but is far more secure than using traditional username and password authentication.

NOTE: In order to access the SFTP server you **must** have a WCHN computer account. This **must** be approved by your collaborating Principal and the WCHN Director. Please contact fil.support@ucl.ac.uk for details. Please see our [policy](#) for masters students.

Windows Setup

The steps for gaining SFTP access:

1. Download [PuTTYgen](#)
2. Open PuTTYgen and click "Generate" to create a public and private keypair. Move the mouse around to create randomness.
3. Copy the full contents from the top box and email to fil.support@ucl.ac.uk. We will use the public key to grant you SFTP access and notify you when ready.
4. It is **highly recommended** you add a passphrase to your private key. This will prevent someone accessing your data by stealing your private key file or using your PC whilst you are logged in.
5. Save a copy of the public key and the private key somewhere local.

Connecting

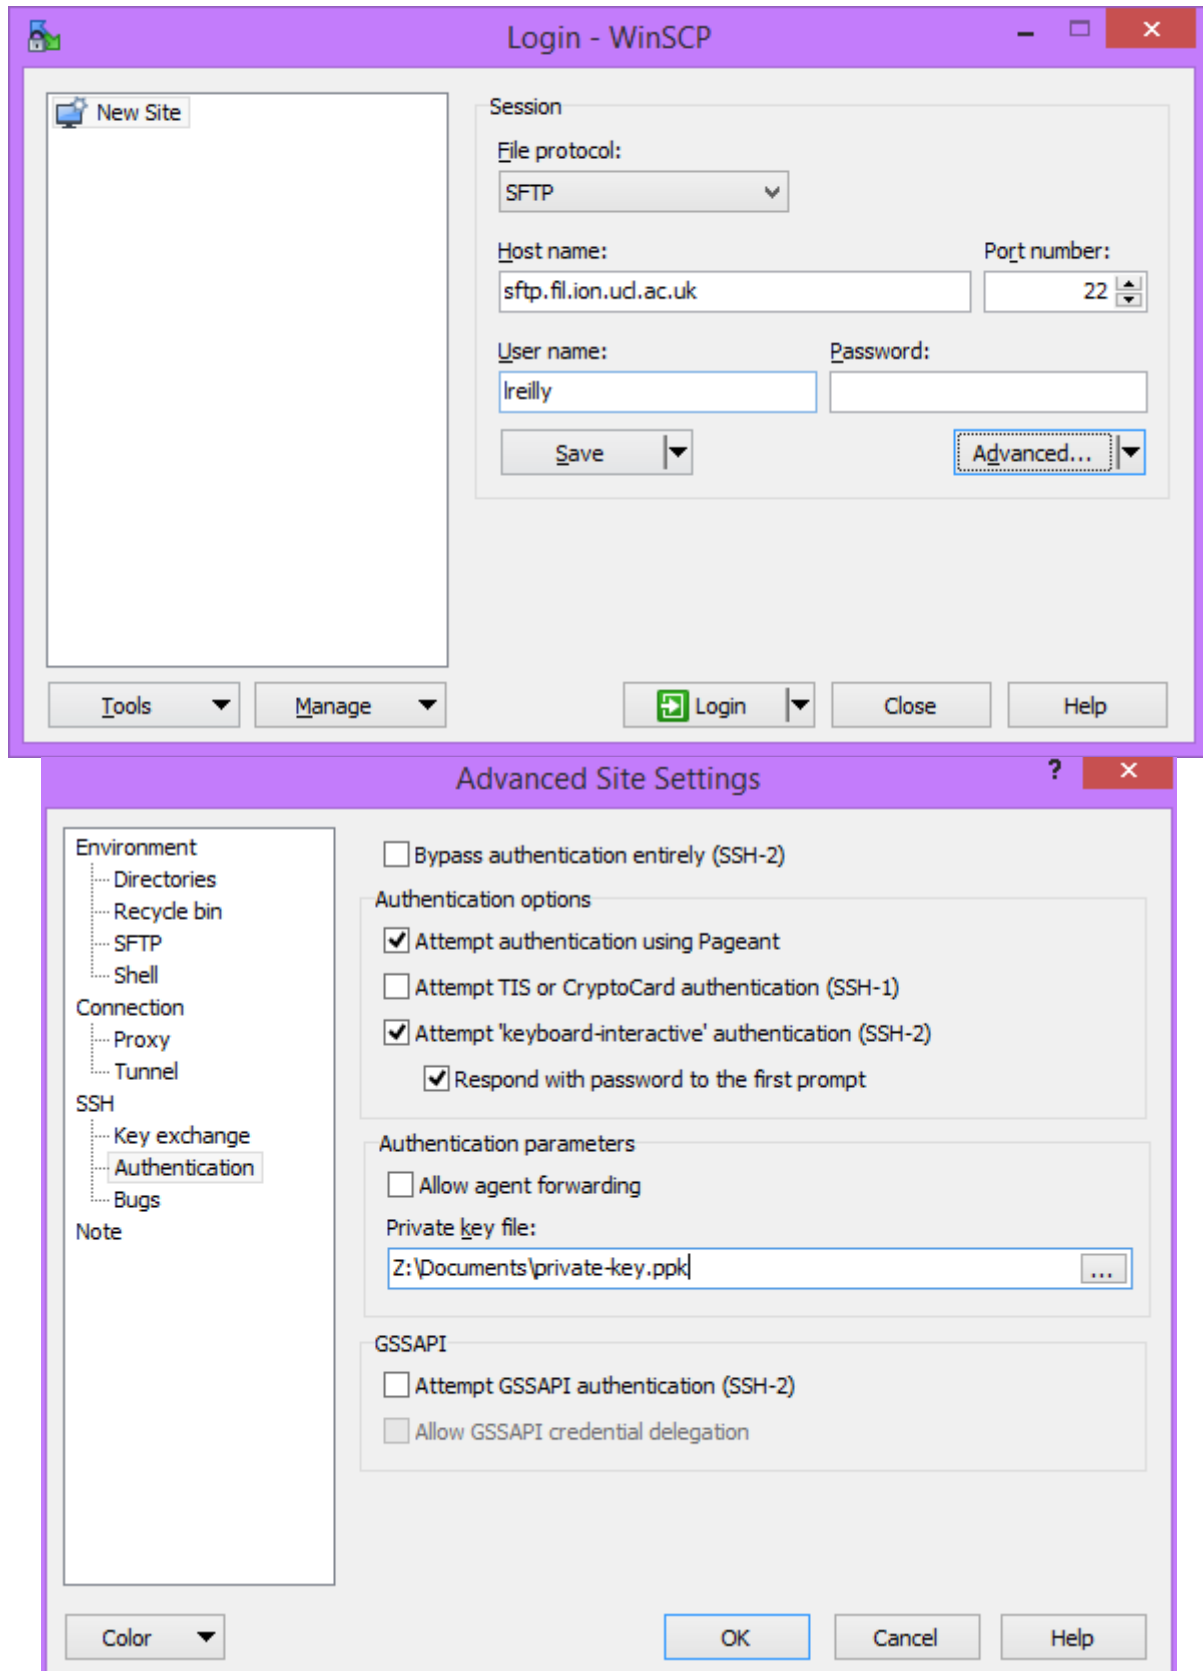

You will need an SFTP client to connect to the server. We recommend the latest version of either [Filezilla](#) or [WinSCP](#).

Open your SFTP client and create a new site/connection configured with these settings:

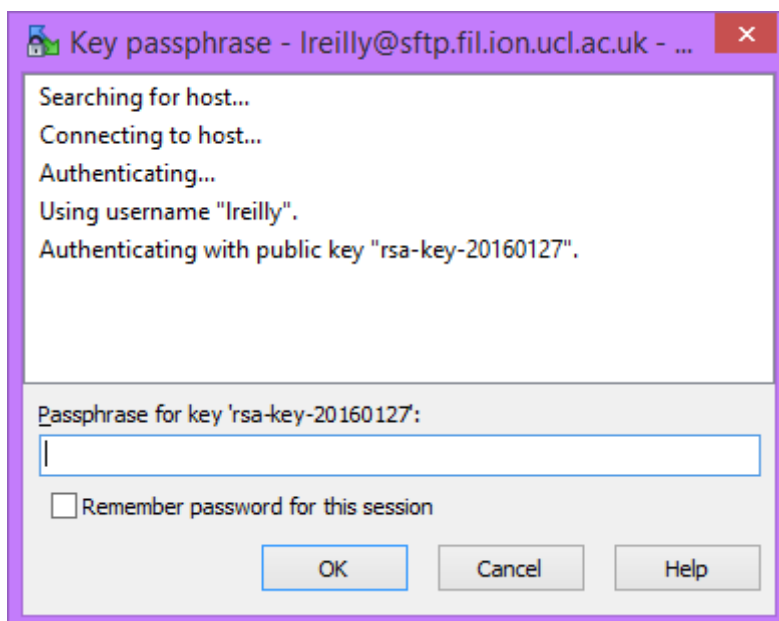

- hostname: `sftp.fil.ion.ucl.ac.uk`
- port: 22
- protocol: SFTP
- username: your WCHN username
- password: *leave blank*

WinSCP

Click 'Advanced...' and under 'SSH > Authentication' click '...' and locate your private key file saved from Puttygen.

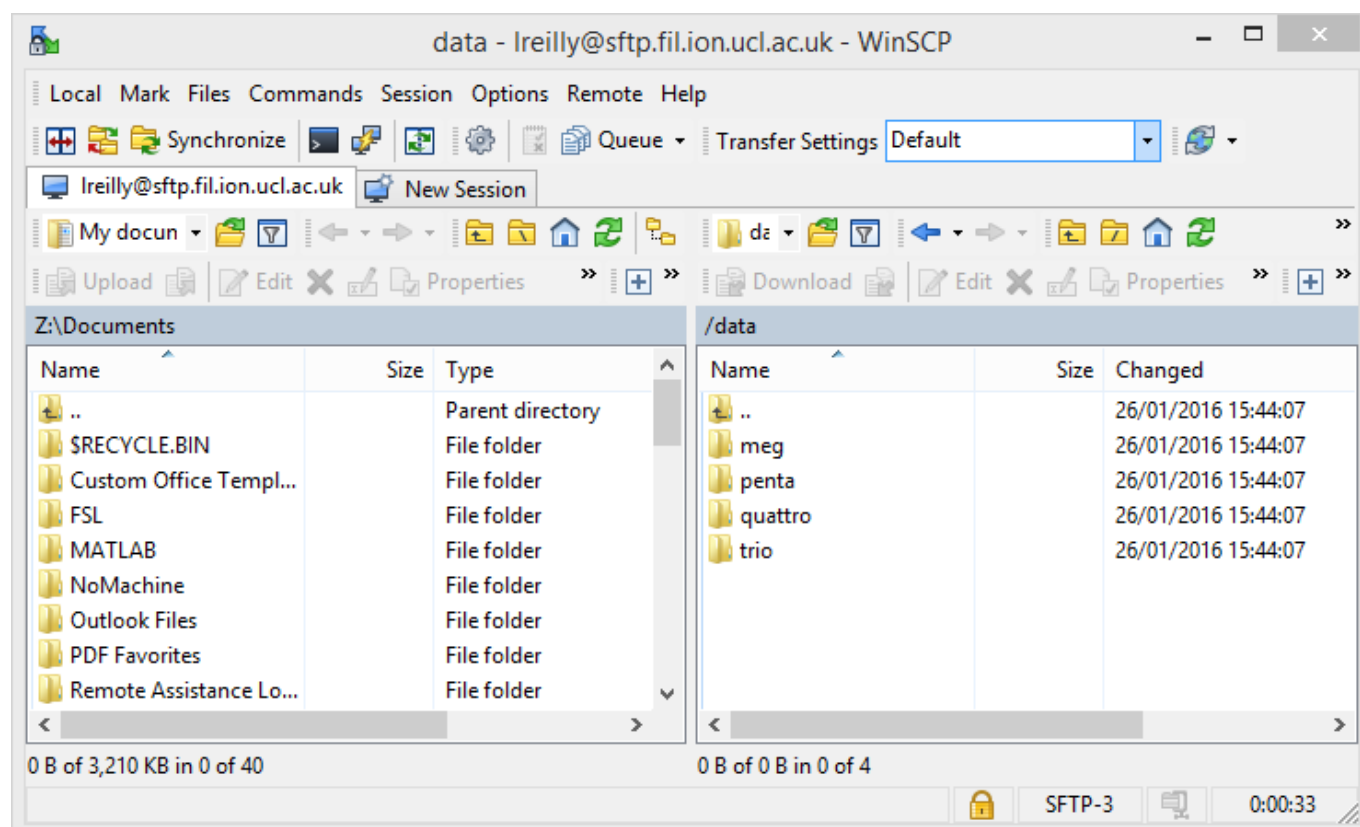

Press 'Login' and you should be prompted for your private key passphrase. (Press 'yes' to any pop-up windows that appear.)

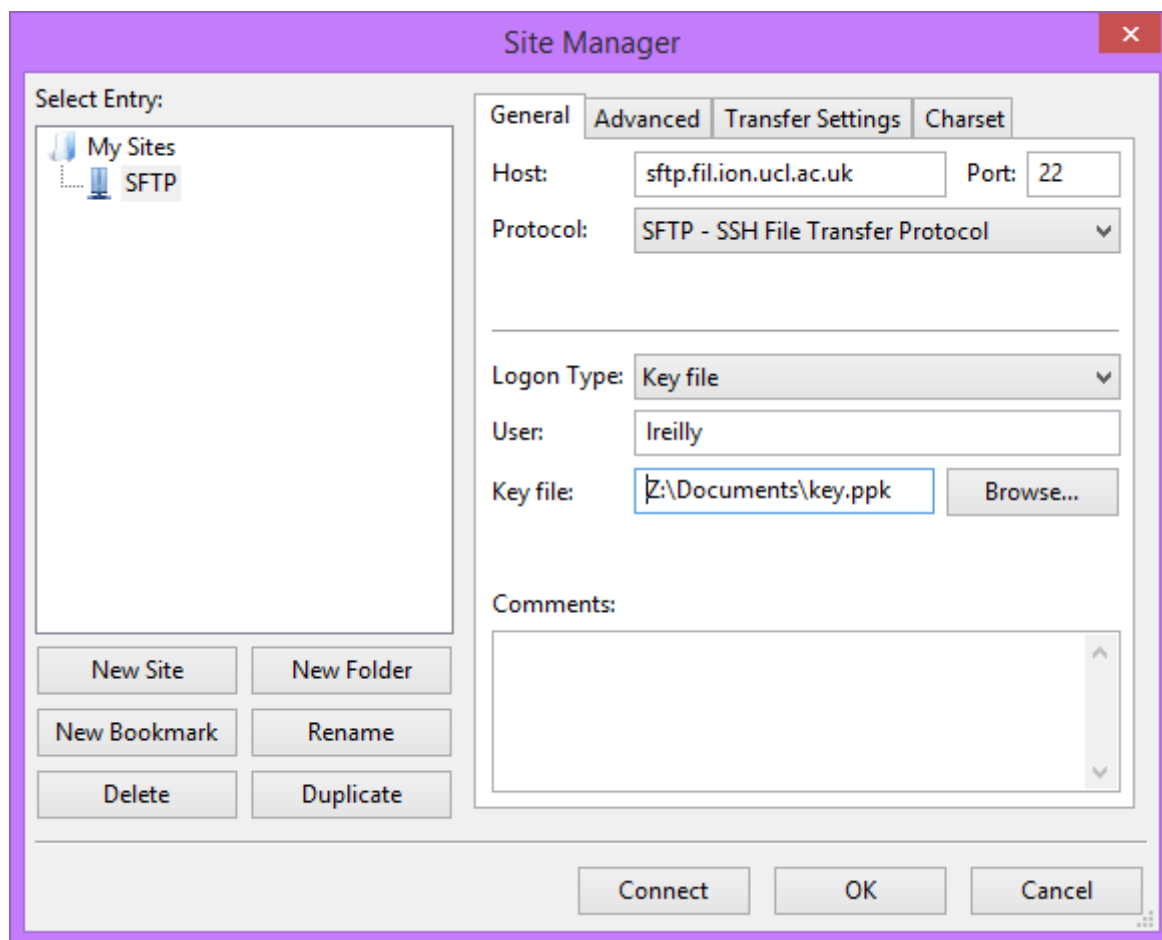

Once entered, you will be connected to your Cher home directory.

From your home directory, you can browse to **/data** to access read-only copies of the data stored on Charm.

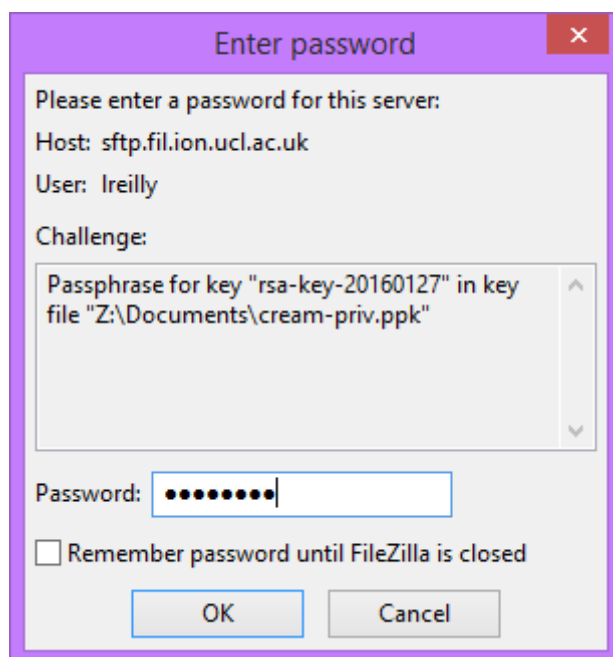

Filezilla

Choose 'Logon Type: Key file' (select Browse... and locate the private key file saved from PuTTYgen)

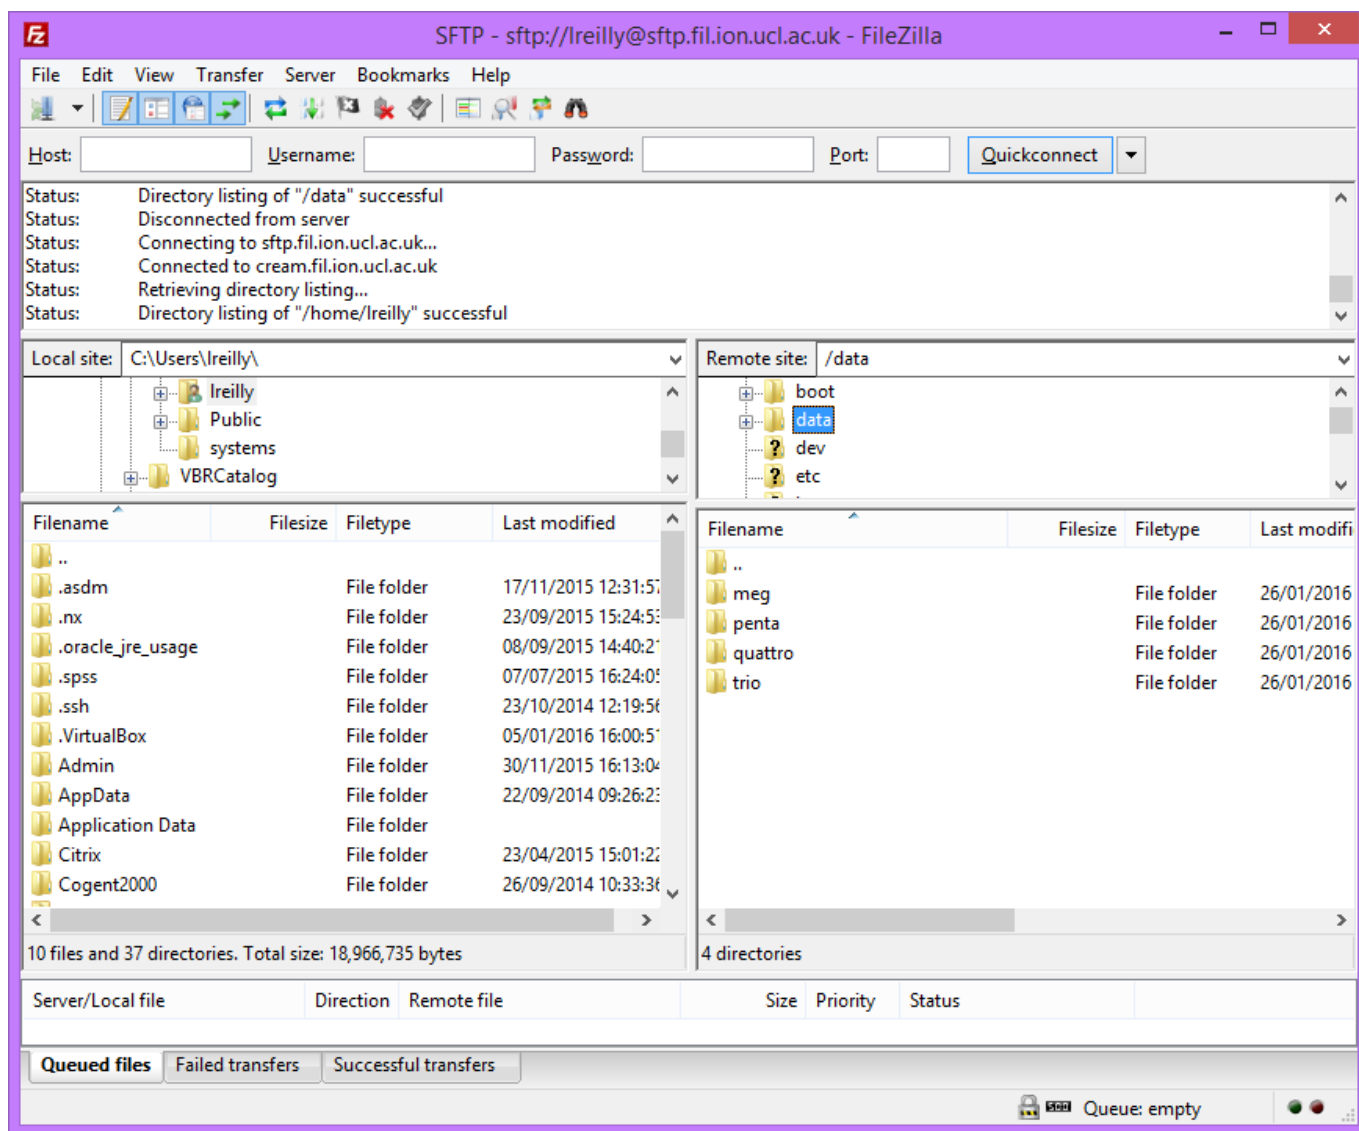

Press connect and you should be prompted for your private key passphrase. (Press 'yes' to any pop-up windows that appear.)

Once entered, you will be connected to your Cher home directory.

From your home directory, you can browse to **/data** to access read-only copies of the data stored on Charm.

Linux/OSX Setup

On Linux and OSX, the process for creating a private/public key pair is slightly different.

- Open the terminal
- Enter command `ssh-keygen -t rsa`
- Choose a filename if desired
- It is recommended you set a passphrase

This will create a private key called `id_rsa` and a public key called `id_rsa.pub` by default. Copy the contents of `id_rsa.pub` and send it to us.

To connect to the SFTP server you can use the terminal with the following command:

- `sftp -i ~/.ssh/id_rsa username@sftp.fil.ion.ucl.ac.uk`

or use an SFTP client as for Windows. [Filezilla](#) is available for both Linux and OSX.

If you have any problems please contact us at fil.support@ucl.ac.uk
